Rachel Adeyemi
Engineering Hiring Lead
Kestrel Robotics
5601 Arapahoe Ave, Boulder, CO 80303

Dear Rachel,

I'm applying for the Senior Embedded Software Engineer role (posting KR-2025-14). For the past five years I've shipped firmware for battery-powered fleet trackers at Waypost Systems · C and Rust on Cortex-M, OTA updates across 40k deployed units, and the kind of power-budget discipline that turns a 9-month battery into a 26-month one.

Kestrel's move to run perception at the edge is the part of the posting that made me write this letter. At Waypost I led the port of our sensor-fusion pipeline from a Linux SBC to a dual-core M7, cutting BOM cost \$34/unit while holding classification accuracy within one point. The war stories (and the flame graphs) are on my site.

Three things I'd bring to the team: a habit of writing the HIL test before the driver, experience running responsible OTA rollouts with staged cohorts and automatic rollback, and genuine fondness for reading errata sheets so my teammates don't have to.

Work samples are at <https://github.com/mtorresnguyen> · the sensor-driver test harness pinned at the top is representative. I'd love to talk; I'm reachable most afternoons at +1 720-555-0195.

Thank you for your consideration,

Malik Torres-Nguyen
