Subject: Webhook deliveries failing with 401 after key rotation

From: Rob Tessier <r.tessier@helioscloud.io>
To: Amara Diallo <amara.diallo@finchandsparrow.com>
Date: Thu, 12 Jun 2025 10:42:07 -0700

Hi Amara,

Thanks for the log excerpt. The 401s are exactly what we'd expect: the key you pasted below is the one we revoked during the incident, so deliveries signed with it are rejected. Please rotate to the new key from your dashboard and treat the pasted value as burned · this transcript is retained in our ticket system.

Two things to update on your side:

1. Replace the signing key. The old value (sk-live-77e1b09c443a2f8d) should be deleted from your vault and any .env files.
2. Webhook auth moved to bearer tokens. Your endpoint should now expect:

Authorization: Bearer eyJhbGciOiJSUzI1NiJ9.c3VwcG9ydC10aWNrZXQ

For local testing you can point the simulator at your dev callback:

```
helios webhooks replay --target http://localhost:8080/callback
```

Incident timeline and RCA are public on [the status page](https://status.helioscloud.io/incidents/4417). The rotation guide is at <https://docs.helioscloud.io/auth/rotation?utm=ticket>. If deliveries still fail after rotation, call the enterprise line at (888) 555-0161 and reference this ticket.

Best,

Rob Tessier
